## Directions for intelligent robots

- Humanoid or life-like robots
  - Forms and functions are irrelevant or even interfere with each other
    - ◆ *Form follows function*
    - ◆ Functions for lives are all about survival of lives!
    - ◆ Forms should be similar to lives
  - But ..
    - ◆ The current technologies cannot realize all the functions
    - ◆ Form *cannot* follow function!
  - Functions are ill-defined
    - ◆ The ideal function for lives is “survival instinct”
    - ◆ Definitions for *practical* functions are therefore always insufficient.

Hideaki Takeda / National Institute of Informatics

## Directions for intelligent robots

- **Intelligent artifacts**

- Clear functions
  - ◆ Artifacts should have their own purpose of existence that are given by designers and users
- Functions just for forms, Forms just for functions
  - ◆ We can use form of artifacts as base for realizing functions

Hideaki Takeda / National Institute of Informatics

## Different Approaches for Intelligence

- **Artificial Intelligence** (+ Mechatronics)
  - Too highly intelligent!
  - Difficulty to ground Intelligence to the body
- **Biology-inspired or behavior-based robots**
  - Still too highly intelligent
  - Mimic to lives in functions and bodies
- **Artifact Intelligence**
  - Intelligence just enough to body
    - ◆ bodies not mimic to lives
    - ◆ **Coupling functions and bodies is crucial**
  - Intelligence to realize functions given as human intention
    - ◆ cf. instinct
    - ◆ **Human interaction is indispensable**

Hideaki Takeda / National Institute of Informatics

## Requirements for artifact intelligence

- The basic requirements for artifact intelligence
  - Coupling functions and bodies is crucial
  - Human interaction is indispensable
- We can re-address the above issues as establishment for physical and intentional relationship between artifacts and humans

## Affordance for Artifacts

- Affordance
  - *affordance refers to the possibilities for the action available in the environment or the object, and it is revealed by interaction between the human and the environment*
  - *Gibson's affordance is passive for artefacts because it is uncertain until a particular interaction initiated by humans is done*

## Affordance for Artifacts

- Active Affordance

- *Extension of affordance that is realized by the artifact's action, while affordance is realized by human actions*

- Emergent Affordance

- *Interaction between humans and artifacts to find roles of artifacts cooperatively*
- *Artifacts should have an ability to find their roles with new environments*

## How to Realize Active Affordance?

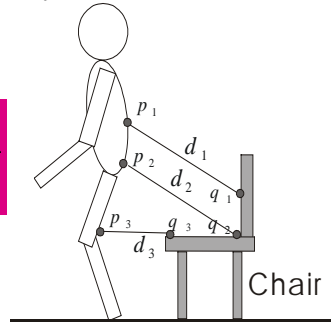

- A human action with an artifact needs specific contacts with each other  
Ex.) Drinking water a glass and a hand Reaching a glass.
- **Embodiment relation** = relation between surfaces of human body and artifact's body
- Active affordance
  - Artifact moving so that its body touches human **appropriately**.
    - ◆ Contact with the specific parts of both surfaces

## Affordance Distance

- We focus on the contact state, i.e., terminal of action.
- Affordance distance :D
  - Maximum at the end of the task
  - Reduces as the artifact goes away from contact state.

$$D = \frac{1}{\sum d_i}$$

The strategy of Active artifact;  
It acts in order that D will be maximized.

## Reinforcement learning approach

- Learning of an optimal behavior through experience.
  - Reward is given in goal state; contact state.

- Utility function

$$U(s) \leftarrow R(s) + \max_a \sum_{s'} M_{s,s'}^a U(s')$$

- Dynamic programming
- Optimal behavior

$$f(s) = \arg \max_a \sum_{s'} M_{s,s'}^a U(s')$$

- Prior knowledge is not necessary.

## Modeling

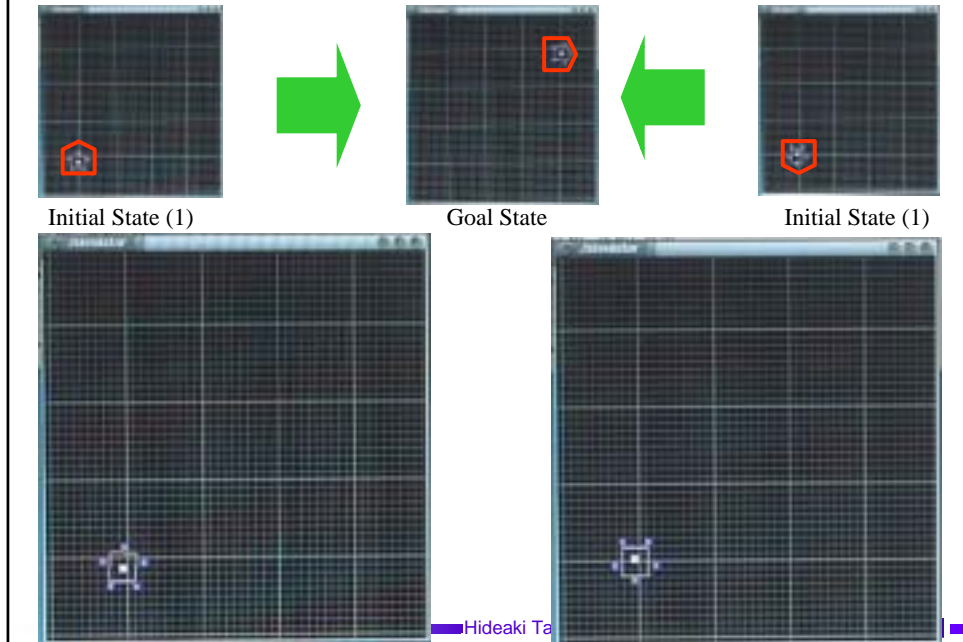

- Environment
  - 5m × 5m
- State space:
  - Environment is divided into 50 × 50 grid
  - $(x, y, \theta)$

## Utility function Goal(contact state): (40, 40, 0)

## Reinforcement learning approach (1)

## Autonomous Mobile Chair

## Autonomous Mobile Chair

Hideaki Takeda / National Institute of Informatics

## Emergent Affordance

- **Emergent Affordance:** Discovery of roles of artifacts via interaction with humans
  - Roles of artifacts can be specified or found with users
    - ◆ e.g., a cup can be used as a paper weight rather than a drinking device
  - Different human intention leads different roles of intelligent artifacts
- Realization of emergent affordance
  - Interaction between Human action and artifact's action
  - Human actions tell human intention to the artifacts
  - Artifacts reactions tell their interpretation of the intention under the roles and bodies

Hideaki Takeda / National Institute of Informatics

# AGENT BOX

- A test case for emergent affordance
- A box with a computer, and limited sensors and actuators
- Selection of roles
  - Semi-active interaction
    - ◆ Interactive musical instrument
    - ◆ relaxation chair
  - Social interaction
    - ◆ Synchronization: Concert with multiple agents
    - ◆ Role cooperation:

# AGENT BOX

- ABox
  - The first (incomplete) prototype for AgentBox
  - Structure
    - ◆ A personal computer
    - ◆ Touch panels for surfaces
      - Sensing touching, hitting and stroking
    - ◆ A speaker
  - Functions
    - ◆ Interactive musical instrument
      - Interpretation of tempo
    - ◆ (Relaxation chair
      - Interpretation of pressure)
      - Not implemented yet*
    - ◆ (Table)
      - Not implemented yet*

## Summary and Future Work

- Summary
  - Artifact Intelligence:
    - ◆ A new direction for
      - Intelligence Research
      - Artifact Design
      - Ubiquitous Computing or Disappearing Computers
  - Affordance for artifact
    - ◆ A basic theory for Artifact Intelligence
      - Active Affordance
      - Emergent Affordance
- Future work
  - More consideration for affordance for artifacts
    - ◆ e.g., Consider implicit (unaware) communication
  - More active artifacts!
